

SCALE FOR PROJECT INCEPTION-OF-T (/PROJECTS/INCEPTION-OF-THING

You should evaluate 3 students in this team

Git repository

`git@vogosphere.42kocaeli.com.tr:vogosphere/intra-uuid-c2bec76`

Introduction

Please comply with the following rules:

- Remain polite, courteous, respectful and constructive throughout the evaluation process. The well-being of the community depends on it.
- Identify with the student or group whose work is evaluated the possible dysfunctions in their project. Take the time to discuss and debate the problems that may have been identified.
- You must consider that there might be some differences in how your peers might have understood the project's instructions and the scope of its functionalities. Always keep an open mind and grade them as honestly as possible. The pedagogy is useful only if the peer-evaluation is done seriously.

Guidelines

- Only grade the work that was turned in the Git repository of the evaluated student or group.
- Double-check that the Git repository belongs to the student(s). Ensure that the project is the one expected. Also, check that 'git clone' is used in an empty folder.
- Check carefully that no malicious aliases were used to fool you and make you evaluate something that is not the content of the official repository.
- To avoid any surprises and if applicable, review together any scripts used to facilitate the grading (scripts for testing or automation).
- If you have not completed the assignment you are going to evaluate, you have to read the entire subject prior to starting the evaluation process.
- Use the available flags to report an empty repository, a non-functioning program, a Norm error, cheating, and so forth. In these cases, the evaluation process ends and the final grade is 0, or -42 in case of cheating. However, except for cheating, students are strongly encouraged to review together the work that was turned in, in order to identify any mistakes that shouldn't be repeated in the future.

 subject.pdf (https://cdn.intra.42.fr/pdf/pdf/163899/en.subject.pdf)

Preliminaries

If cheating is suspected, the evaluation stops here. Use the "Cheat" flag to report it. Take this wisely, and please, use this button with caution.

Preliminary tests

- Defense can only happen if the evaluated group is present. This way, everybody learns with each other.
- If no work has been submitted (or wrong files, or wrong directory, or wrong filenames), the evaluation process ends.
- For this project, you have to clone the Git repository on the group's machine.

- For this project, you must use the virtual machine of 42.

✔ Yes

✕ No

General instructions

General instructions

- During the defense, whenever you need help in order to verify a requirement of the sub group must help you.
- Ensure that all the files required for the three different parts of the project are in the fold respectively. There may be an additional bonus folder.

✔ Yes

✕ No

Mandatory part

The project consists of setting up several infrastructures with different services that use K3s, Vagrant, K3d, and Argo CD. Make sure that all of the following requirements are met.

Global configuration and explanation

- Those being evaluated should explain to you in a simple way:
 - The basic operation of K3s.
 - The basic operation of Vagrant.
 - The basic operation of K3d.
 - What is a continuous integration and Argo CD.

✔ Yes

✕ No

Part 1 - Configuration

- Check that a Vagrantfile is present in the p1 folder. Once done, check its content. Thank you, evaluated persons, you should basically understand this file. It must be similar to the example subject.
- Check that there are two virtual machines in the Vagrantfile.
- In the Vagrantfile, check that the latest stable version of the distribution of the choice of OS is used for both virtual machines.
- Check that the primary network interface of each host has the required IP address as specified in the subject.
- The names chosen for the two virtual machines must include a login of a member of the group. For the first machine, it must be followed by S (like Server), and for the second one, by SW (like Server and Workstation). If something does not work as expected, the evaluation stops here.

✔ Yes

✕ No

Part 1 - Usage

- Use Vagrant to SSH into both virtual machine with the help of the evaluated group.
- Ensure that the primary network interface has the required IP addresses by using the `ifconfig` command. For macOS: `ifconfig en0` For the latest Linux distributions: `ip a show $(ip route | grep default | awk '{print $2}')` (to dynamically detect the primary interface).
- Ensure both machines have the hostname required by the subject.
- Then, check that both virtual machines use K3s. The evaluated group should be able to verify this by running the `kubectl` command on the Server machine: `kubectl get nodes -o wide` An output similar to the example in the subject is expected. The evaluated group must explain to you the output. If something does not work as expected, the evaluation stops here.

✔ Yes

✕ No

Part 2 - Configuration

- To avoid space/performance issues, you can of course shut down every other running virtual machine with the help of the evaluated group.
- Check that a Vagrantfile is present in the p2 folder. Once done, check its content. Thank you, evaluated persons, you should basically understand this file. It must be similar to the example part 1 of the subject.
- Check that there is only one virtual machine in the Vagrantfile.
- In the Vagrantfile, check that the latest stable version of the distribution of the evaluated group is used for the virtual machine.
- Check that the primary network interface has the required IP address as specified in the subject.
- The name chosen for the virtual machine must include a login of a member of the group with capital letter S.

- If extra files are present in the p2 folder, verify them and ask for explanations. If something expected, the evaluation stops here.

✓ Yes

✗ No

Part 2 - Usage

- Use Vagrant to SSH into the virtual machine with the help of the evaluated group.
- Ensure that the primary network interface has the required IP addresses by using the following commands: For macOS: "ifconfig en0" For the latest Linux distributions: "ip a show \$(ip route | grep ^\$)}" (to dynamically detect the primary interface).
- Ensure the machine has the hostname required by the subject.
- Then, check that the virtual machine uses K3s. The evaluated group should be able to list the nodes.
- Verify that the virtual machine meets the subject's requirements. To do so, use the following command: "kubectl get nodes -o wide" It should display the name of the controller and the internal IP address. It should display 3 applications. For reference, you can find an example in the Part 2 subject. The evaluated group must explain to you each output. Next, they must show you the commands to run the applications. The command is deliberately not given here.
- Now, check that the 3 applications can be accessed depending on the HOST header (to look at the subject). To do so, you can use curl with the help of the evaluated group, or just use a web browser (application). You will have to change the HOST in order to see some differences.

If something does not work as expected, the evaluation stops here.

✓ Yes

✗ No

Part 3 - Configuration

- Thanks to the evaluated group, start up the infrastructure.
- Check that the configuration files are present in the p3 folder. Once done, check their content and ask for more precise explanations. This part is essential to understand what's next.
- Make sure there are at least 2 namespaces in K3d: "argocd" and "dev". Use the command: "kubectl get namespaces" to verify.
- Verify that there is at least 1 pod in the "dev" namespace. Use the command: "kubectl get pods -n dev" to verify.
- Ensure the group members understand the differences between a namespace and a pod.
- Check that all the required services are running with the help of the evaluated group.
- Check that Argo CD is installed and configured. You can access it in your web browser. It should show a login page and a password. The evaluated group will give them to you.
- Check that the login of someone of the group was put in the name of the Github repository. The name could be "wil_config" or "wil-ception". Read the subject carefully to verify.
- Check that a Docker image is used in the Github repository. The image can be Wil's or the evaluated group's. In the second case, verify that the login of a member of the group was put in the name of the repository. Also, ensure that there are the two required tags in the Dockerhub repository.
- If there are extra files in the p3 folder, ask for explanations. If something does not work as expected, the evaluation stops here.

✓ Yes

✗ No

Partie 3 - Usage

- Now that you can use Argo CD, try to understand how it basically works. With the help of the evaluated group, navigate through the application. Do not hesitate to ask questions here. If you have any doubts, their explanations are confused or they can't explain something they should know, the evaluation stops here. It is important.
- Check that the v1 application can be accessed from this machine. You can use curl (the command is given in the usage in the subject).
- Verify that Dockerhub is used. This part is important. In case of any doubt, the evaluated group must help you.
- Since you can see the v1 application, you must be able to update it with the help of the evaluated group. Check the configuration file on GitHub that Argo CD relies on. You must commit and push a modification to the repository to automatically trigger the update of your application. You must be able to understand how to use Argo CD. Do not hesitate to ask for explanations.
- Now that you have pushed the v2 application on Github, if synchronizing didn't happen, check the status of the application. CD (if it did happen, skip this step). The evaluated people must help you.
- Ensure that the application was successfully synchronized using the operation given as an example in the subject. The evaluated people must help you.

If something does not work as expected, the evaluation stops now.

✓ Yes

✗ No

Bonus

Evaluate the bonus part if, and only if, the mandatory part has been entirely and perfectly done. If the evaluation management handles unexpected or wrong usage. In case all the mandatory points were not done, defense, bonus points must be totally ignored.

Bonus

- Check if there are configuration files in the bonus folder. Ask for explanations about each
- Test that Gitlab functions correctly and was properly implemented. To do so, create a new help of the evaluated group. Then, try to add some code in it. Check the operation was
- The last step is quite simple. Make sure that the operations of the part 3 of the subject are Ensure that the repository used in Argo CD is a local repository on Gitlab. The evaluate you in this process so you can verify the operations works as expected with the two ver application.
- If the synchronization and the version change of the application are completed with no error part.
